NEW ANTAGONIST COMPOUNDS

Field of the invention

The present invention is related to novel δ opioid receptor antagonists as well as to their pharmaceutically acceptable salts, a process for their preparation and their use in the manufacture of pharmaceutical preparations.

Background of the invention

Opiod antagonists have been indispensable as tools in opioid research. For example, the chief criterion for the classification of an agonist effect as being opioid receptor mediated is the ability of known opioid antagonists naloxone or naltrexone to reversibly antagonize this effect in a competitive fashion. The usefulness of naloxone and naltrexone for this purpose stems from the fact that they are universal opioid antagonists; that is, they are capable of antagonizing the agonist effects mediated by multiple opioid receptor types.

Since it is now firmly established that there are a minimum of three opioid receptor types (μ, κ and δ), it has become increasingly evident that selective opioid antagonists are valuable pharmacological tools for identifying receptor types involved in the interaction with opioid agonists. One of the major advantages of selective opioid antagonists over selective agonists is their utility in probing the interaction of endogenous opioid peptides and new opioid agonists with opioid receptor types. Moreover, since it is sometimes not easy to distinguish among μ, κ and δ opioid receptor mediated agonist effects if the pharmacological endpoints are identical (e.g. antinociception or inhibition of a smooth muscle preparation by agonists), selective antagonists clearly have wider utility as tools than selective agonists.

The general utility of selective antagonists as pharmacological tools depends upon the correlation of in vitro and in vivo acitivity. This can be accomplished more easily with non-peptide ligands because they generally can penetrate the blood-brain barrier and therefore can be administered peripherally in vivo. Also, they are less subject to metabolism than are peptides.

In addition to their uses as pharmacological tools, selective, non-peptide opioid antagonists have been described as having potential clinical applications in the treatment of a variety of disorders where endogenous opioids play a modulatory role. These include for instance disorders of food intake, shock, constipation, mental disorders, CNS injury, alcoholism, and immune function (immune stimulation or suppression) (P.S. Portoghese et al., J. Med. Chem., Vol 34: 1757-1762, 1991).

Non-peptide, competitive, δ-selective opioid antagonists have been found recently. The prototypes are: cyprodime for μ (H. Schmidhammer et al., J. Med. Chem., Vol. 32:418-421, 1989; H. Schmidhammer et al., J. Med. Chem., Vol. 33: 1200-1206, 1990), norbinaltorphimine for κ (P. S. Portoghese et al., J. Med. Chem., Vol. 30:238-239, 1987), and naltrindole for δ opioid receptors (P.S. Portoghese et al., J. Med. Chem., Vol. 31:281-282, 1988).

These compounds (cyprodime, norbinaltorphinine and naltrindole) are being used as pharmacological tools. They have been tritium labelled and can be used as receptor selective ligands in opioid receptor binding studies to sort out the affinities of new ligands to different receptors and to determine whether a compound is selective to a special receptor.

An object of the present invention was to find new, highly selective δ opioid receptor antagonists with high potency. Another object was to find highly selective δ opioid receptor antagonists with high immunosuppressive potency. The high selectivity for δ opioid receptors would repress adverse side effects

caused by the interaction with other receptors. Still another object was to find compounds which have a brain-cell protecting effect. The problem with the δ opiod receptor antagonists known from the prior art is that they are not highly selective.

Prior art

Certain opioid agonists represented by morphine, which act on μ receptors, are known to exhibit immunosuppressive effects. The agonist enkephalin, which acts on δ opioid receptors, exhibit immunostimulating effects (Plotnikoff, Enkephalins and Endorphins, Stress and Immune System, Plenum Press, 1986). Although a number of reports have been issued concerning the immunosuppressive effects of agonists of μ receptors, it is difficult to develop an immunosuppressive agent by employing an agonist of μ receptors, since such agonists show critical side effects such as addiction, respiratory depression, constipation etc.

Recently it has been reported that δ-selective opioid antagonists have immunosuppressive effects. See EP 456 833, EP 485 636 and EP 614 898.

Phenylhydrazine substituted at the aromatic ring with hydroxy, halogen, C_1-C_6 alkyl, C_1-C_6 alkoxy, amino, nitro, cyano, thiocyanato, trifluoromethyl, CO_2H, CO_2 (C_1-C_6) alkyl, $CONH_2$, CONH (C_1-C_6 alkyl), CON (C_1-C_6 alkyl)$_2$, SO_2NH_2, SO_2 (C_1-C_6) alkyl or the like may be employed. The reaction may be carried out at a temperature between 20 and 160 °C, preferably between 20 and 80 °C.

The preferred dose for injection is 20-500 mg per day.

Biological studies

δ-Antagonism was assessed using the electrical stimulated guinea-pig ileum longitudinal muscle preparation (GPI; containing μ and κ opioid receptors) and mouse vas deferens preparation (MVD; containing μ, κ and δ opioid receptors) (H. Schmidhammer et al., J. Med. Chem., Vol. 32: 418-421, 1989; H Schmidhammer et al., J. Med. Chem., Vol. 33: 1200-1206, 1990). The activity of the compound 1 of the Examples for inhibiting the suppression of contraction of the organs by three receptor selective agonists (DAMGO, μ; Cl 977, κ; DPDPE, δ) was measured. The compound exhibited δ-selective opioid antagonism with very good μ/δ and κ/δ selectivity ratios.

Conclusion

The pharmacological studies of the novel morphinan derivatives of formula (I) of the present invention have shown that these compounds have selectivity for δ opioid receptors and are effective as opioid antagonists.

International application No.
PCT/SE 95/00503

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. [X] Claims Nos.: 14-15
because they relate to subject matter not required to be searched by this Authority, namely:

This International Searching Authority found multiple inventions in this international application, as follows:

1. [ ] As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. [ ] As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. [ ] As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. [ ] No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

[ ] The additional search fees were accompanied by the applicant's protest.

[ ] No protest accompanied the payment of additional search fees.
